Auto CMDB – Bundle with Asset Network Connection Extension

The ITSM add-on can display connections and dependencies between existing assets or CIs based on various informations. **The number of licenses is based on the number of licenses of the existing Workspace Management product. Please contact your sales representative for an individual offer.**

Description

The ITSM add-on can display connections and dependencies between existing assets or CIs based on various informations. Asset connections and dependencies are automatically read out from the system without time-consuming manual maintenance and then clearly visualised.

Features:
– Extension of the CIs to include their network connections
– Maintaining dependencies between network devices
– Establishing relations between virtual machines, ESX hosts and vCentres
– Maintaining the dependency of applications on the executing host

"Auto CMDB" is extended with "Asset Network Connection Extension":
The extension documents the port data of network switches. The network infrastructure is mapped in the Matrix42 ESM. You get an overview of which client is connected to which port. The ports of a network device can be stored and linked as objects in the system.

Technical requirements:
· Matrix42 Enterprise Service Management (the standard supported versions)
· Asset Network Connection Extension Modul (included)

Video:

The number of licenses is based on the number of licenses of the existing Workspace Management product.

Please contact your sales representative for an individual offer.
