Local Inventory

Local Inventory continuously collects all relevant hardware and software data and transmits it to the central server at regular intervals. The best thing about this is that all that is required to implement the Local Inventory is a simple distribution to the relevant computers.

Description

In the world of software asset management (SAM), the focus is on the inventory of software and hardware. It is crucial to always be up to date with the latest information on licenses and patch statuses. In most scenarios, the inventory is usually initiated from a central server. All end devices must first be added to the inventory list so that the server can retrieve the necessary data.

But what if there was a way to start the inventory directly from the end devices? This is exactly what our solution, the "Local Inventory", makes possible. This innovative technology makes it possible to initiate the inventory from any end device. The Local Inventory continuously collects all relevant hardware and software data and transmits it to the central server at regular intervals. The best thing about this is that all that is required to implement the Local Inventory is a simple distribution to the relevant computers. The inventory is then carried out automatically, transforming the traditional server pull into an efficient push process directly from the end devices.

Labtagon's inventory solution offers you the opportunity to reliably and effectively inventory all end devices, including the associated software and licenses. We focus on the essentials and deliberately avoid superfluous features in order to offer you a lean yet powerful solution. In this way, you can ensure that your inventory processes run smoothly without being slowed down by unnecessary ballast.

The advantages at a glance

- **Zero Trust Inventory**
  Enables the decentralized and continuous recording of device information, regardless of the network location.
- **Optimizing SAM**
  Support of the SAM through reliable data collection and updating.
- **Automatisation**
  Automatic data transfer: The collected information is automatically transmitted to the central server at regular intervals.
- **Easy to use**
  The implementation of Local Inventory only requires the distribution of the tool on the relevant end devices.
- **No Overkill Solution**
  Lean design without unnecessary features for efficient inventory.
